Lords Commissioners,

For Executing the Office of

Lord High-Admiral of Great-Britain.

My Lords,

HIS Abstract, containing nothing but what comes under your Lordships Cognizance, was put in Print for no other end, than for your Lordships more easy Perusal. The Author never designing to make it Publick, without your Lordships Approbation. Your Lordships are farther Humbly desir'd to observe, That the first Article of the Three intended upon this Subject, is all that

that the Author's Circumstances would as yet permit him to pick out of the numerous and various Observations he from time to time has made upon, the great and many unperceived Occasions of Sickness in Fleets, and Ships of War. I am,

My Lords, brimbA-dgill bio I

An ABSTRACT of Some Years Observations, &c.

HESE Occasions of our Sickliness are treated of in the following Sheets, in three diffinct Articles, viz. In

Article 1. Such Occasions of our Sickliness that proceed from the nature of our Mens Duty. and Allowances of Keeping, befides their own want of Care in the Service.

Article II. Such Occasions of Sickliness which proceed from the want of rightly order'd, and used Hofpital Ships.

Article III. Such Occasions of Sickliness as most neceffarily flow from the usual Management of Physick, and Surgery in the Fleet.

Article I. Of the Occasions of Sickliness that arise from the nature of our Duty, &c. at Sea.

I shall briefly premise, I. That although all Men That Man and of common Understanding are, at Years of Discretion, Beast at liberty fufficiently enabled, by their common Experience (as to themselves. the Beafts are by Instinct) to judge what fuits best or worst with their Health; according to a vulgar Say. That the Naing, (viz. Every Man is a Fool or a Physician.) Yet neither Man nor Beaft can possibly make so effectual or less, does use of fuch natural notices, when they are under the Management of others, as when they are at their own use of this na-Disposal. Witness Guinea-Slaves, and labouring Cattle; tural Benefit. which feldom ail any thing, till they are put under

ture of their Subjection, more binder their making a right

the

the Yoke of others. Whence, both Man and Beaft, by natural Instinct, hate Confinement; and are never brought to comply with it, but by force of Custom and Necessity.

That for this fures to supply this defeat.

2. That, for this very Reason, the greatest Generals Caufe, Gene- have ever used more than ordinary Diligence to disco. rals take mea- ver, and to remedy all such Occasions of Sickliness amongst their Men; which proceed either from their own Neglects, or from the nature of their Duty.

That Physicians 2. That Physicians and Surgeons at Sea, only re-& Surgeons are gard Diseases already formed; but have neither Pow-Judges of such er, much less any experience in Generalship, to prematters. The vent the general Occasions of Sickliness. Nay, on the ferve the Cau- contrary, these Men often are too generally no small Occasions of our Sickliness; either through want of And may them. Skill, or Diligence; and consequently, by suffering Difeases that might have been prevented by timely Skill, to run to a pitch of Malignity and Infectiousness, as shall be made appear, God willing, in Article 3. of this Eslay.

Besides, that the ablest Physicians that ever appear'd in the World have made it out upon Record, that hardly one of ten Medicines in common use, is otherwife necessary, but for keeping up the Pomp of the Profession, and gratifying the Apothecaries, who have fo long been the main Supporters and Introducers of most Physicians ; (whence the Fleet has been so commonly fitted with Medicines, much more for the Interest of the Apothecary, and his Favourites, than for that of the Service;) but rather very much to the contrary, as the faid third Article will make good.

4. That the general Occasions of Sickline's treated of in this Article, are owing to the want of necessary Precaution, against the Injuries of the fix following Particulars, that relate to what we call good Keeping vizar entropic til thorace with

1. Of the Air we live in ; namely, as well the o- First general pen Air, as that within Board. For that the first of occasion of these is a most constant general Cause of our Sickness, Sickliness. appears palpably from hence, viz. That our Sicknef- That the open fes are all of one and the same kind, on Board of e-Air is a most very Ship in the fame Fleet, tho' not equally violent. of our Difeases And, 2. That as the Season or Climate are varied, so at Sea. do all our Distempers vary to the very same kinds. For instance, in our own Seas, our Feavers are most commonly Aguish, and tedious, especially Spring and Fall; but as the Fleet proceeds to the Westward, our Feavers change gradually into very malignant, infectious, and mortal ones, all over the same Fleet, even before they arrive at the West-Indies: Whilst, in proceeding towards the Streights, and Southern Seas, they grow gradually more continual, and incline to Loofness;

which foon turns bloody and infectious.

But this might be made out by many Observations; as of the great difference of Gravity and Springiness that is to be observed betwixt the Sea-Air, and that on Shoar. Likewise by the notable grosness of the Sea-Air, in comparison to that of the Continent, namely, by which it furrounds and covers our Land-Air and Soil, (in Great Britain, and other Islands) from the violent Heats of some more Northerly Countries. and from the piercing Frosts of some more Southerly Parts. Moreover, by that intolerable Stink it prefents us with, in close, fultry, calm Weather; by which it plainly discovers what noxious Contents it abounds with. Also by the suddeness, frequency, variety, violence, and unforeseen Alterations of its Storms; which the more untoward they at any time happen to be, the more our Men are obliged to be exposed to them, con- And that it trarywise to what it is on Shoar. Which I hope will therefore rebe enough to evince, that ten times more caution, if ter precaution possible, is requir'd against the Injuries of the open than is would

Air at Sea, than on Shore. And confequently, that more than ordinary Precaution, with regard to the following Particulars, is absolutely necessary, towards rendring our Fleets and Ships healthy.

And that partiing Accounts.

These Particulars are, 1. The ill Consequences of cularly, upon that long Confinement of impress'd Men, on Board of Tenders; In want of fufficient Cloathing, Bedding, Room, Exercise, and too often even of Victuals. For, upon these accounts, I constantly observ'd the first Rife of Sickliness in our Ships, to be owing to such Men. who most commonly brought their Illness on board with them. 2. Of entring or impressing infirm. or otherwife useless Creatures but for number sake. For fuch I always found to be the very next subjects of our Sicklinesses; if not to be often before-hand with the other. 3. Of keeping poor naked Wretches (being press'd without Necessaries) two Months on. Board, before that Slops (for bedding and cloathing) can be iffued out to 'em. For fuch never failed, fenfibly to augment the numbers of our Sick. As, 4. Of the Infufficiency of the usual Slops; which to my certain knowledge, many poor Sailors trusting to, have fuffer'd very much by Sickness. 5. Of fuch as fell their Cloaths for a little good Suck (as they call the very worst of Spirits; for Suttling is still kept on foot by one means or other.) And who, rather than fail, will take up Slops and Tobacco of the Purser for that use. For which reason, I have oftner than once obtain'd of my Commanders, in Men of War, to have a fearch made for all the Spirits that were on board, and to have them fecur'd, and ferv'd out as occasion required. 6. Of such, who in great numbers, fcorn to shift after being Wet, or have nothing to shift withal, who usually added not a few to our fick Numbers. 7. Of those who scorn to put on their Cloaths after hot Work, or in the Evening of a hot Day, and

the like. 8. Of such, who in great Numbers Dare all Weathers with open Breafts, and laugh at almost all Advices that pre-suppose Mortality. And, in the last place, of those who, in their Liquor, chuse to seen any where, but in their Hammocks; as on bare Decks. Chefts, or expos'd to cool Air, the fcorching Sun. the Dew, Cold, and the like. For I never observ'd any cause of Feavers more common, Suttling being too fweet a Trade to be easily retrench'd.

How flight foever the abovefaid Occasion may feem That these Negto be, at first view, yet, if I may conclude any thing led's give great from constant Experience, these Means alone are e- ries of the open nough to confume all the Navy Allowance for Me-Air. dicinal Stores; provided a Surgeon be honest, and understand his Business; which was the only Cause why I found my felf oblig'd to accept of Hospital Ships, fooner than 'twas otherways my Interest to do, as be-

ing at no Expence for Medicines in them.

It is true, the first two or three of the Inconveni- That the first ences nam'd, may feem incapable of Remedy; because three seem cathey are the unavoidable Refults of Impressing, which pable of Remeis hitherto so indispensably necessary. Nevertheless I the present nehave often thought, and discours'd of an Expedient, cessity of Impresamong fome Persons of good Judgment, which I fing, by a diffecould gladly wish some of deeper Understanding in Cloathing. fuch Marters had in Confideration; because I never could hear any material Objection against its Feisableness and Use, in this Particular, viz. To have all Her Majesty's Seamen cloath'd on a like foot, and in a corresponding manner, to that of the Soldiery (bating for Fashion to be adapted to the Work, and the Stuff, which for the Out-fides might be strongest Canvafs. Tarpawling, or the like). For by this means, 1. The fame Care would be had of the Cloathing. both by Commanders and Men, as is had amongst the Soldiery. By which means our Men would be unfpeak-

medy, even in

frieakably better fecur'd against the Injuries of the Air aforefaid. 2. Our Sailors would be thereby confiderable Savers, and nothing nigh fo much at the devotion of Landladies and Slop-fellers, that fo much debauch 'em from the Service, as 'twill hereafter farther appear. 3. It might be made a Capital Crime to wear any other Cloathing, while in the Service, or till one is fairly discharg'd, or perhaps till one has actually recover'd a Receipt for his Cloathing. And, Care being taken that no other Cloathes are kept by any of the Men on board, I imagine it might prove a very effectual Expedient, as well against Deserting, as against the foresaid three first Occasions of Sickness, which I mention'd, nograted a behavore say he

That the other fix both deferve, pable of Remedy.

the give great नां की पति भी भी

But however that be (for I pretend not to be able to give a decisive Judgment in any of the Particulars I and are very ca- mention, in this Paper) yet I'm very inclinable to think, that the remaining Occasions I nam'd, and which very much increase our Sickliness, might, by good looking after, eafily be remedied. For which I once had the successful Experience of a worthy Commander; who, speaking upon that Subject, was often pleas'd to tell me, he laid it down for a Principle, that Sailors, generally speaking, have as much need of good looking after, in all that relates to their Health, on board, as younger Folks in a Family; not only on account of what their Duty exposes em to, but, more especially, of their childish Indiscretion.

That the particular Air of a ter or smaller occasion of Sickliness, according to their Seasoning and Keeping.

Thus far of the Injuries of the open Air. Now Ship, is a grea- for those of the Air within Board, which I hope easily to make appear to deserve no less Consideration. For that it, most commonly, is a very considerable Occasion of Sickliness, and Loss of Men, is palpable from hence, viz. Because any common reigning Distemper of the whole Fleet, is always observ'd to be confiderably more fierce on board of fome Ships, than

it is in the rest; without any other assignable Cause. than what we call the particular Unwholfomeness of the Ship, that is (in very deed) of the Air of the Ship. About which every one commonly make their Observations. As particularly that a Ship which is very tight under Water, and leaky above, is commonly unhealthy, in comparison to those of the contrary Conditions. Nor indeed can it be otherwise. in the main, with Ships, than with Houses, in this Particular. The last whereof being ill kept. or badly feafon'd, has been a notorious Occasion why one Fa-

mily has fuffer'd confiderably more, by the reigning Distemper of a Season, than others. In a word, so noted an Occasion of desperate and fatal Sickliness has the unwholfome Air of a Ship been reputed, that no Pains have been commonly spar'd for correcting it.

As by clearing a Ship of all the Sick at once; then washing, scraping, airing Chests and Hammocks, Funking with Pitch, and other Gumms; fprinkling

with Vinegar, yea even by letting in plenty of Water. by a Plughole, into the Bilge; and often, and much

Pumping.

But the worst is, that notwithstanding all these That none of Means are carefully us'd, the very same Ships prove the usual Mein a little time, as unhealthy as before. Which feems ring a Ship plainly to argue, I. That the unwholfome Air with- been effectual, in board of fuch Ships, ows its hurtful Taint to the for the followwant of a like Seasoning, before, or at fitting out to me Reasons. Sea, as new Houses, or old, and for sometime uninhabited Ones always require, before a Family can expect to live healthy in them. 2. That this tainted Air, of an unwholfome Ship, is constantly supply'd with Recruits of its noisom Contents, from the very Materials of the Ship. Else the letting in of much clear, and pumping out all the choaking Bilge Water, with the other usual Methods above-mention'd, would effectu-

effectually render fuch a Ship wholfome. Contrary to what our daily Experience teaches us. For as a peftilent Air is ever observ'd to infect even the Walls and Goods in Houses, so a long included Air, as well as Water, in a much pefter'd Ship, may, for want of Communication with the open Air, putrify, and produce an ill Quality, that infinuating it felf into the Materials of a Ship, may be a confiderable time the occasion of unwholsome Air in the same Ship, as long included and damp Air renders Houses unwholfome. Nor is any thing more obvious to common Observation, than that Ships do generally require a proportionable Time at Sea, to that they lay up in, to make 'em healthy; and that even new Ships often require a feafoning Time there, before they are obferv'd to be comparatively healthy. And therefore it How this might follows, 3. That this Unwholfomeness may be preprobably be re-vented, or taken off beforehand (fince some Ships are actually free of it.) And that more particularly by a different way of keeping our Ships in the Ordinary, and of feafoning new ones. For instance, at least for fome time before fitting out, fuppose that Ships be very much and often pump'd, by letting in Water on purpose, which benefits fuch Ships as happen to be very leaky while they lie up, have of necessary Course, and perhaps would be found to have been far more healthy, on that account, than fuch Ships as did not happen to require such frequent pumping, if the Difference were narrowly to be inquir'd into. Likewife were all the Cavities of Ships that lie up, especially for some time before fitting out to Sea, to be as clear of an manner of Lumber as may be possible, and much, and frequently expos'd to free and dry Air (if not also well season'd by as cautiously kept Fires, as we use in Bread-rooms, before we take in our Provifions.) No doubt it would fweeten a Ship confiderably,
